## Assignment 4

Title : GUI programming using Swing

Problem Statement: Transform the system from command line to GUI Based Application

Objective : Understand the implementation of swing class

Outcome:

Students will be able to evaluate & analyze the problem & understand the GUI concepts in JAVA

Software & Hardware Req:

64 bit OS , JDK , JDE , Intel I5 Processor + , 4+GB RAM.

Theory:

Java Swing is a part of Java Foundation applications (JFC) that is used to create window based applications. It is built on the top of AWT, API & completely written in JAVA

The JAVA Swing package provides classes for JAVA Swing API such as JButton, JTextfield, Jmenu, etc.

## Difference between AWT & Swing

Java AWT	Java Swing
1) Platform dependent	1) Platform independent
2) Heavy weight	2) light weight
3) Doesn't support plugable look feel	3) Supports pluggable look & feel
4) less components than swing	4) more powerful components
5) Doesn't follow MVC (model view controller)	5) follows MVC

### \* Container classes:

Container classes are classes that can have other components on it so for creating a GUI we need atleast one container object.

### Three types of containers

- 1) Panel
- 2) Frame
- 3) Dialog

## Java Swing Class hierarchy diagram

Object	JText	JTextField
Component	JComboBox	JTextArea
Container	JLabel	
Window JComponent	JList	
Frame Dialog	JMenuBar	
JFrame JDialog	JOptionPane	
	JPanel	
	JScrollBar	
	Abstract	JButton

### Java JLabel

It is a component for a single text in a container. It is used to display a single line of read only text. The text can be changed by an application but the user can't change it.

Java JTextArea:

The object is a multiline region that displays text. It allows the editing of multi-line text.

Java JCheckBox

The JCheckBox class is used to create a checkbox. It is used to turn an option on or off.

Java JRadioButton:

It is a class to create a radiobutton. It is used to choose one option from multiple options.

Result: All test cases yield result 'PASS'

Conclusion:

We were able to make a user-friendly Swing Application in Java.
